

## the place group powerline data network

We have invested in state of the art technology providing the “place group powerline data network” which has made wired access to the internet possible through all of the standard electric plug sockets in each house, in addition to the more familiar password protected wireless access, which is also available.

**Fast - Up to 200Mbit/s**

**Secure**

**Reliable**

**No Configuration Required**

**Available through every electrical plug socket**

Along side the powerline data network we have also installed a wireless network with WPA encryption. For your own security, your specific wireless password (WPA Key) will be advised at check-in.

Wired access is through all of the standard electric plug sockets in each house.

This means you can connect your laptop / PC via an Ethernet Cable to any standard electric plug socket in any room to receive high-speed internet access.

No additional cables are needed, but you will need a PLC adapter for this, for which a small refundable deposit is payable per adapter. Wired access does not require any password, and access is instant. Anyone visiting you can, with your permission, access the internet from any machine which they connect to the network in this way with no additional configuration or permission from us needed.
